Overview of The Project

This will cover almost everything about the project and **please notice the grading criteria on page 2-3**.

- Assessment

Component	Marks	Timing
Topic Pitch	5	Week 6
What You Did	10	Week 11
Lessons Learned from Using AI	10	Week 11
Total	**25**	

- Timelines:

3. Schedule

Date	Time	Activity
Week 4	Lecture time	Project introduced. Start forming groups and exploring ideas.
26 September Saturday	23:59	Group formation should be confirmed. Groups should have 4–5 students.
Week 6	Lecture time	Short in-class Topic Pitch. After the pitch, teams may still refine or change their direction.
10 October Saturday	23:59	Topic fixed and submitted.
Weeks 6–10	---	Project development.
14 November Saturday	23:59	Final submission: Project Demo Video + Lessons Learned Video + Contribution Statement (and project output/link if relevant).
Week 13-14	**TBD**, hopefully the weekend of Week 13	Face-to-face team Q&A with the teaching team. No prepared presentation is required.

- What we need to do:

Part 1 — Do Something with AI

Choose something your team wants to attempt and use AI to help you do it. The form is intentionally open. For example, you might:

- create or build something;
- learn or understand something that has been difficult for you;
- try something creative that you previously lacked the skills to make;
- help a real person with a real need;
- investigate a question or claim;
- solve a real problem or improve something you already do;
- or do something completely different.

Your project does not have to succeed perfectly. An ambitious attempt that produces interesting failures, surprises, or lessons can also be a strong project.

Part 2 — Lessons Learned from Working with AI

While doing the project, pay attention to what actually happens when you work with AI. Your lessons may include:

- what AI was surprisingly good at;
- what AI struggled with or misunderstood;
- what you had to verify, change, or reject;
- where human knowledge, judgment, creativity, taste, or responsibility mattered;
- what should or should not be delegated to AI;
- what surprised you and how your approach changed;
- what you would do differently next time.

Your lessons should come primarily from your actual project experience. They do not need to be universal. Specific lessons from a real attempt are often more useful than generic advice about AI.

- Material:
  - **Grading Criteria**:

B. What You Did — 10 marks

Criterion	Marks	What we look for
Meaning and ambition of the attempt	2	The team attempts something genuinely interesting, useful, meaningful, or challenging to them. "Ambitious" does not mean technically complicated or flashy.
Real engagement with the task	3	The team actually explores the problem rather than simply producing a polished final output. **There is evidence of trying, testing, revising, comparing, or responding to what happened**.
Purposeful use of AI	2	AI is used to extend what the team can do. The team makes active choices about how AI is used rather than simply accepting whatever it generates.
Outcome / what was actually achieved	3	The team clearly demonstrates what they made, learned, tested, discovered, or accomplished. A meaningful failed attempt can also score well if the exploration is substantial.

C. Lessons Learned from Using AI — 10 marks

Criterion	Marks	What we look for
Grounded in the actual project	4	Lessons clearly come from things that actually happened during the project and are supported by concrete examples rather than generic statements about AI.
Depth of reflection	3	The team goes beyond describing what happened and explains why it happened, what they learned, and how their understanding or approach changed.
Human judgment and responsibility	3	The team identifies where human decisions, evaluation, verification, creativity, knowledge, taste, or responsibility mattered, and explains how these affected the project.

- Submissions of Deliverables:

5. Final submission

The team leader should submit the following items on behalf of the group. All videos should be accessible to the teaching team.

Deliverable 1 — Project Demo Video (about 5–10 minutes)

Show us what your team actually attempted and what happened. The video should make the project easy to understand even if the project output takes a form that is difficult to submit directly.

The video should cover:

- what you tried to do and why you chose it;
- how AI was used in the project;
- what you actually made, tested, investigated, learned, or experienced;
- what happened in the end, including important changes, failures, or surprises.

If your project produces an output (for example, software, a website, a game, artwork, music, a prototype, data, or another artifact), you may also submit or link to it where practical. **The video remains the main way for the teaching team to understand your project.**

Deliverable 2 — Lessons Learned from Using AI (about 5–10 minutes)

Create a short AI Fluency / Lessons Learned video based on what actually happened during your project.

Do not simply repeat general statements such as "AI can hallucinate" or "we should verify AI outputs." **Use concrete examples from your own project to explain**:

- what worked and what did not;
- what you had to verify, change, reject, or rethink;
- where human judgment and responsibility mattered;
- what your team would do differently next time.

Deliverable 3 — Contribution Statement

The team leader must also submit a short contribution statement describing the main contribution of each member. All team members should review and agree with this statement before submission.

10. Submission of Deliverables

For the final submission, **the team leader should submit ONE PDF file on Canvas on behalf of the whole group**.

The PDF should include:

- Group number and project title
- Names of all team members
- Project Demo Video link
- Lessons Learned from Using AI Video link
- Project output / artifact link, if relevant
- Contribution Statement, briefly describing the main contribution of each team member

The two videos should normally be uploaded to **YouTube as Unlisted videos**. **Do not set the videos to Private**. The teaching team should be able to open the links directly without requesting access.

All submitted links must remain accessible to the teaching team until the end of the semester.

A suggested format is:

Group: LEC00X Group XX
Project Title: ...

Project Demo Video: [YouTube link]
Lessons Learned Video: [YouTube link]
Project Output / Artifact: [link, if applicable]

Contribution Statement
Student A — ...
Student B — ...
Student C — ...
Student D — ...

All team members have reviewed and agreed with this contribution statement.

Please name the submitted PDF: **LEC00X_groupXX_submission.pdf**

AI TRAINING

We will plan what we're gonna do (like creating AI by what platform or making a website or etc). You can write Ideas in the AI training if you have any bright Ideas or advice. Everything that has been confirmed in part of the AI creation will be on here.

Video Creation

Anyone related to the video creating task will post the progress here or if they are too busy then they will just need to write what is the progress of the video creation so that we can help them if we need to.

CHECKLIST

This will be our timelines and stuff we need to complete during the project

- ☐ Finish Brainstorming and choose a fixed topic.
  (Done before 10/10/2026)
- ☐ Submitted the topic.
  (Deadline: 10/10/2026)
- ☐ Task assigning and making the AI model.
  (This have to be quick because video creation would be long and while making the AI model we will take some part of the training to put into the video or we can make the scene if necessary)
- ☐ Submit Project Demo Video
  Lesson learn Video
  Contribution Statement
  (Project output/ link if relevant)
  (Deadline: 14/11/2026)
- ☐ Preparations for face-to-face Q&A questions.
  (Deadline: week 13-14)

Topic pitch

Each group will briefly present its current project idea to the class. A typical pitch for each group should take about **4** minutes, with **2** minutes' presentation followed by short questions or comments from classmates

- Main Idea (temporary): A website that uses AI to help students make a flexible plan for the semester. The website helps the student reduce a huge workload of manually arranging calendars for classes and deadlines.
    - Input SDF and Outline file.
    - Generates a calendar consisting of class schedules, assignment deadlines, and quizzes.
    - Sends timely reminders for all classes, deadlines, and quizzes.
    - If there is ambiguity in any date or time, it can be changed or flagged manually.

Q&AS:

Q1: What do you want to do?

- An AI that gives generic advice, guessing based on standard internet templates and local university data that are given in our raw university course syllabus.

Q2: Why does your team find it interesting or worth trying?

- We find that almost all students find organizing files and handling deadlines very stressful so they get overwhelmed with work and don't know what to do. While some are struggling with organization, there are some that tend to forget deadlines and classes which result in grades deduction and sometimes course failure. Because of this, we turn to AI for help, but that is exactly where our experiment begins. We want to see if relying on AI automated calendars keeps students safe or if it's a logical blind spot to actually put their grades at risk.

Q3: How might AI help you do something that would otherwise be difficult?

- It helps all students to avoid manually double checking five different 10 page documents just to keep up with the stacked deadlines that take hours of their life. However, while AI is great at doing this speed reading in

seconds, it still lacks human common sense which is why our team must step in to fix its logical blind spot.

Potential Questions:

1. How does the AI accommodate tentative schedules, and assignments that are released mid-semester?

2. How are the reminders sent? And when are they sent?

3. How do you ensure the schedule formed is accurate?

4. How is this different from asking an AI model to make a calendar?

5. What happens if an AI messes up and fails to remind or create a deadline for you?

6. Where can I use this AI?

7. Are there any requirements for the information sent to AI?&

Experiment & Failure Logs

This is the log for mainly what went wrong and what went right so that we can write a script and make the video.

Potential advice

Advices for the Video:
